Queen's University Belfast Colloquium

September 28, 2018

AED for generalized Toeplitz matrices

• Assume a sequence of $n \times n$ matrices $\{A_n\}_{n \ge 1}$ is given.

イロト イヨト イヨト イヨト

• Assume a sequence of $n \times n$ matrices $\{A_n\}_{n \ge 1}$ is given.

 Q_1 : Where the eigenvalues of A_n cluster as $n \to \infty$?

• Assume a sequence of $n \times n$ matrices $\{A_n\}_{n>1}$ is given.

 Q_1 : Where the eigenvalues of A_n cluster as $n \to \infty$?

• Limit points of eigenvalues:

$$\Lambda(A) := \Big\{ \lambda \in \mathbb{C} \mid \liminf_{n \to \infty} \operatorname{dist} (\lambda, \operatorname{spec}(A_n)) = 0 \Big\},$$

• Assume a sequence of $n \times n$ matrices $\{A_n\}_{n>1}$ is given.

 Q_1 : Where the eigenvalues of A_n cluster as $n \to \infty$?

Limit points of eigenvalues:

$$\Lambda(A) := \Big\{ \lambda \in \mathbb{C} \mid \liminf_{n \to \infty} \operatorname{dist} (\lambda, \operatorname{spec}(A_n)) = 0 \Big\},$$

i.e.,

$$\lambda \in \Lambda(A) \quad \Leftrightarrow \quad \exists \{n_k\} \nearrow \infty \quad \exists \lambda_k \in \operatorname{spec}(A_{n_k}) \quad \text{ s.t. } \lambda_k \to \lambda.$$

• Assume a sequence of $n \times n$ matrices $\{A_n\}_{n>1}$ is given.

 Q_1 : Where the eigenvalues of A_n cluster as $n \to \infty$?

Limit points of eigenvalues:

$$\Lambda(A) := \Big\{ \lambda \in \mathbb{C} \mid \liminf_{n \to \infty} \operatorname{dist} (\lambda, \operatorname{spec}(A_n)) = 0 \Big\},$$

i.e.,

$$\lambda \in \Lambda(A) \quad \Leftrightarrow \quad \exists \{n_k\} \nearrow \infty \quad \exists \lambda_k \in \operatorname{spec}(A_{n_k}) \quad \text{ s.t. } \lambda_k \to \lambda.$$

 Q_2 : At what asymptotic density the eigenvalues of A_n cluster as $n \to \infty$?

• Assume a sequence of $n \times n$ matrices $\{A_n\}_{n>1}$ is given.

 Q_1 : Where the eigenvalues of A_n cluster as $n \to \infty$?

Limit points of eigenvalues:

$$\Lambda(A) := \Big\{ \lambda \in \mathbb{C} \mid \liminf_{n \to \infty} \operatorname{dist} (\lambda, \operatorname{spec}(A_n)) = 0 \Big\},$$

i.e.,

$$\lambda \in \Lambda(A) \quad \Leftrightarrow \quad \exists \{n_k\} \nearrow \infty \quad \exists \lambda_k \in \operatorname{spec}(A_{n_k}) \quad \text{ s.t. } \lambda_k \to \lambda.$$

 Q_2 : At what asymptotic density the eigenvalues of A_n cluster as $n \to \infty$?

The eigenvalue–counting measure:

$$\mu_n := \frac{1}{n} \sum_{\lambda \in \operatorname{spec}(A_n)} \delta_{\lambda}.$$

• Assume a sequence of $n \times n$ matrices $\{A_n\}_{n>1}$ is given.

 Q_1 : Where the eigenvalues of A_n cluster as $n \to \infty$?

Limit points of eigenvalues:

$$\Lambda(A) := \Big\{ \lambda \in \mathbb{C} \mid \liminf_{n \to \infty} \operatorname{dist} (\lambda, \operatorname{spec}(A_n)) = 0 \Big\},$$

i.e.,

$$\lambda \in \Lambda(A) \quad \Leftrightarrow \quad \exists \{n_k\} \nearrow \infty \quad \exists \lambda_k \in \operatorname{spec}(A_{n_k}) \quad \text{ s.t. } \lambda_k \to \lambda.$$

 Q_2 : At what asymptotic density the eigenvalues of A_n cluster as $n \to \infty$?

• The eigenvalue-counting measure:

$$u_n := \frac{1}{n} \sum_{\lambda \in \operatorname{spec}(A_n)} \delta_{\lambda}.$$

AED μ:

$$\boxed{\mu_n \xrightarrow{\mathbf{w}} \mu,} \quad \text{i.e., } \forall \varphi \in \mathcal{C}_0(\mathbb{C}) : \ \int_{\mathbb{C}} \varphi \, \mathrm{d}\mu_n \to \int_{\mathbb{C}} \varphi \, \mathrm{d}\mu.$$

One has

$$T_n(a) \xrightarrow{s} T(a) \quad \text{in } \ell^2(\mathbb{N}),$$

where T(a) is the bounded operator given by the respective semi-infinite Toeplitz matrix and $T_n(a)$ is identified with $P_nT(a)P_n$ where P_n is the OG projection onto span $\{e_1, \ldots, e_n\}$.

Consequently,

spec
$$T(a) \subset \Lambda(T(a))$$
.

In fact,

spec
$$T(a) = \Lambda(T(a))$$
.

• O. Toeplitz (1911), N. Wiener (1932):

spec
$$T(a) = \left[\min_{z\in\mathbb{T}} a(z), \max_{z\in\mathbb{T}} a(z)\right].$$

In total, for s.-a. Toeplitz from the Wiener class it holds that

$$\Lambda(T(a)) = \operatorname{spec} T(a) = \left[\min_{z \in \mathbb{T}} a(z), \max_{z \in \mathbb{T}} a(z)\right].$$

• The Szegő first limit theorem:

$$\lim_{n\to\infty}\frac{1}{n}\operatorname{Tr}\left(T_n(a)\right)^k=\frac{1}{2\pi}\int_0^{2\pi}a^k(e^{it})\mathrm{d}t,\quad\forall k\in\mathbb{N}.$$

<ロ> <同> <同> < 同> < 同>

• The Szegő first limit theorem:

$$\lim_{n\to\infty}\frac{1}{n}\operatorname{Tr}\left(T_n(a)\right)^k=\frac{1}{2\pi}\int_0^{2\pi}a^k(e^{it})\mathrm{d}t,\quad\forall k\in\mathbb{N}.$$

• Reformulation:

$$\lim_{n\to\infty}\int_{\mathbb{R}}x^{k}\mathrm{d}\mu_{n}(x)=\int_{\mathbb{R}}x^{k}\mathrm{d}\mu(x),\quad\forall k\in\mathbb{N},$$

where

$$\mu((\alpha,\beta)) = (2\pi)^{-1} | \{t \in [0,2\pi] | \alpha < a(e^{it}) < \beta \} |.$$

The Szegő first limit theorem:

$$\lim_{n\to\infty}\frac{1}{n}\operatorname{Tr}(T_n(a))^k=\frac{1}{2\pi}\int_0^{2\pi}a^k(e^{it})\mathrm{d}t,\quad\forall k\in\mathbb{N}.$$

• Reformulation:

$$\lim_{n\to\infty}\int_{\mathbb{R}}x^{k}\mathrm{d}\mu_{n}(x)=\int_{\mathbb{R}}x^{k}\mathrm{d}\mu(x),\quad\forall k\in\mathbb{N},$$

where

$$\mu((\alpha,\beta)) = (2\pi)^{-1} \left| \{t \in [0,2\pi] \mid \alpha < \mathbf{a}(\mathbf{e}^{\mathsf{i}t}) < \beta \} \right|.$$

• Applying Stone–Weierstrass, we get the AED:

$$\lim_{n\to\infty}\int_{\mathbb{R}}\varphi(x)\mathrm{d}\mu_n(x)=\int_{\mathbb{R}}\varphi(x)\mathrm{d}\mu(x),\quad\forall\varphi\in\mathcal{C}(\mathbb{R}).$$

i.e., $\mu_n \xrightarrow{w} \mu$.

• The Szegő first limit theorem:

$$\lim_{n\to\infty}\frac{1}{n}\operatorname{Tr}(T_n(a))^k=\frac{1}{2\pi}\int_0^{2\pi}a^k(e^{it})\mathrm{d}t,\quad\forall k\in\mathbb{N}.$$

• Reformulation:

$$\lim_{n\to\infty}\int_{\mathbb{R}}x^{k}\mathrm{d}\mu_{n}(x)=\int_{\mathbb{R}}x^{k}\mathrm{d}\mu(x),\quad\forall k\in\mathbb{N},$$

where

$$\mu((\alpha,\beta)) = (2\pi)^{-1} |\{t \in [0,2\pi] \mid \alpha < a(e^{it}) < \beta\}|.$$

Applying Stone–Weierstrass, we get the AED:

$$\lim_{n\to\infty}\int_{\mathbb{R}}\varphi(x)\mathrm{d}\mu_n(x)=\int_{\mathbb{R}}\varphi(x)\mathrm{d}\mu(x),\quad\forall\varphi\in\mathcal{C}(\mathbb{R}),$$

i.e., $\mu_n \xrightarrow{w} \mu$.

• Roughly speaking:

"For n large, the eigenvalues of $T_n(a)$ are distributed as the values of $t \mapsto a(e^{it})$."

・ロット (雪) (き) (き)

Example:

$$a(z) = z^{-2} - 2z^{-1} - 2z + z^2.$$

ヘロン 人間 とくほど 不良と

Example:

$$a(z) = z^{-2} - 2z^{-1} - 2z + z^2.$$

This means

$$T(a) = \begin{pmatrix} 0 & -2 & 1 & & & \\ -2 & 0 & -2 & 1 & & & \\ 1 & -2 & 0 & -2 & 1 & & \\ & 1 & -2 & 0 & -2 & 1 & & \\ & & 1 & -2 & 0 & -2 & 1 & \\ & & & 1 & -2 & 0 & -2 & 1 & \\ & & & & \ddots & \ddots & \ddots & \ddots & \ddots \end{pmatrix}$$

・ロト ・回ト ・ヨト ・ヨト

Example:

$$a(z) = z^{-2} - 2z^{-1} - 2z + z^2.$$

$$\lim_{n\to\infty} \big|\det(T_n(b)-\lambda)\big|^{1/n} = g(\lambda)$$

locally uniformly in $\mathbb{C} \setminus \Lambda(T(b))$. In addition, one has

$$g(\lambda) = \exp\left(rac{1}{2\pi}\int_{0}^{2\pi}\log\left|b(
ho e^{\mathrm{i}t})-\lambda\right|\mathrm{d}t
ight),$$

・ロト ・ 国 ト ・ ヨ ト ・ ヨ ト … ヨ

where $|z_r(\lambda)| < \rho < |z_{r+1}(\lambda)|$. (Recall $\lambda \in \Lambda(T(b)) \Leftrightarrow |z_r(\lambda)| = |z_{r+1}(\lambda)|$.)

Hirschman's formula for AED

Theorem (Hirschman Jr., 1967):

For a banded Toeplitz matrices, the AED μ exists and is absolutely continuous. On each analytic arc of $\Lambda(T(b))$, its density reads

$$\frac{\mathrm{d}\mu}{\mathrm{d}s}(\lambda) = \frac{1}{2\pi} \frac{1}{g(\lambda)} \left| \frac{\partial g}{\partial \vec{n}}(\lambda+) - \frac{\partial g}{\partial \vec{n}}(\lambda-) \right|,$$

where ds stands for the arc-length measure on the respective arc and $\partial g/\partial \vec{n} (\lambda \pm)$ are one-sided limits of the directional derivative $\partial g/\partial \vec{n}$ w.r.t. a unit normal vector to the arc at λ (depends on a chosen orientation but the formula for the density does not).

All the essential results for the *limiting set* Λ(T(b)) (Schmidt & Spitzer) and the *limiting measure* μ (Hirschman) concern banded Toeplitz matrices only.

- All the essential results for the *limiting set* Λ(T(b)) (Schmidt & Spitzer) and the *limiting measure* μ (Hirschman) concern banded Toeplitz matrices only.
- K. Michael Day (1975) generalized these two results for Toeplitz matrices with rational symbol.

$$T_n(\mathbf{a}) = \left(a_{j-k}\left(\frac{1+\min(j,k)}{n}\right)\right)_{j,k=0}^{n-1},$$

i.e.,

$$T_{n}(a) = \begin{pmatrix} a_{0}\left(\frac{1}{n}\right) & a_{-1}\left(\frac{1}{n}\right) & a_{-2}\left(\frac{1}{n}\right) & \dots & a_{-n+1}\left(\frac{1}{n}\right) \\ a_{1}\left(\frac{1}{n}\right) & a_{0}\left(\frac{2}{n}\right) & a_{-1}\left(\frac{2}{n}\right) & \dots & a_{-n+2}\left(\frac{2}{n}\right) \\ a_{2}\left(\frac{1}{n}\right) & a_{1}\left(\frac{2}{n}\right) & a_{0}\left(\frac{3}{n}\right) & \dots & a_{-n+3}\left(\frac{3}{n}\right) \\ \dots & \dots & \dots & \dots & \dots \\ a_{n-1}\left(\frac{1}{n}\right) & a_{n-2}\left(\frac{2}{n}\right) & a_{n-3}\left(\frac{3}{n}\right) & \dots & a_{0}\left(\frac{n}{n}\right) \end{pmatrix}$$

- Introduced and studied by M. Kac, W. L, Murdock, and G. Szegő in 1953 (called *generalized Toeplitz*). For a_k(x) = a_k, T_n(a) is a Toeplitz matrix.
- Later appeared several times again and some results from Kac, Murdock, and Szegő were rediscovered:
 - P. Tilli, 1998: motivation: discretization of 1D S.-L. operator → theory of locally Toeplitz sequences, applications in PDEs (Garoni, Serra–Capizzano, 2017).

・ロット (雪) (き) (き)

- Let $a_k \in C([0, 1])$ are given for all $k \in \mathbb{Z}$.
- The KMS matrix:

$$T_n(\mathbf{a}) = \left(a_{j-k}\left(\frac{1+\min(j,k)}{n}\right)\right)_{j,k=0}^{n-1},$$

i.e.,

$$T_{n}(a) = \begin{pmatrix} a_{0}\left(\frac{1}{n}\right) & a_{-1}\left(\frac{1}{n}\right) & a_{-2}\left(\frac{1}{n}\right) & \dots & a_{-n+1}\left(\frac{1}{n}\right) \\ a_{1}\left(\frac{1}{n}\right) & a_{0}\left(\frac{2}{n}\right) & a_{-1}\left(\frac{2}{n}\right) & \dots & a_{-n+2}\left(\frac{2}{n}\right) \\ a_{2}\left(\frac{1}{n}\right) & a_{1}\left(\frac{2}{n}\right) & a_{0}\left(\frac{3}{n}\right) & \dots & a_{-n+3}\left(\frac{3}{n}\right) \\ \dots & \dots & \dots & \dots & \dots \\ a_{n-1}\left(\frac{1}{n}\right) & a_{n-2}\left(\frac{2}{n}\right) & a_{n-3}\left(\frac{3}{n}\right) & \dots & a_{0}\left(\frac{n}{n}\right) \end{pmatrix}$$

Generalized First Szegő Limit Theorem

• The symbol:

$$a(x,t)=\sum_{k=-\infty}^{\infty}a_k(x)e^{ikt}$$

・ロト ・回ト ・ヨト ・ヨト

Generalized First Szegő Limit Theorem

• The symbol:

$$a(x,t)=\sum_{k=-\infty}^{\infty}a_k(x)e^{ikt}$$

• Assumptions:

1)
$$\sum_{k=-\infty}^{\infty} ||a_k||_{\infty} < \infty$$
 (~ the Wiener class)
2) *a* is real-valued $\Leftrightarrow T_n(a) = (T_n(a))^*, \quad \forall n \in \mathbb{N}.$

・ロト ・回ト ・ヨト ・ヨト

Generalized First Szegő Limit Theorem

• The symbol:

$$a(x,t) = \sum_{k=-\infty}^{\infty} a_k(x) e^{ikt}$$

• Assumptions:

1)
$$\sum_{k=-\infty}^{\infty} ||a_k||_{\infty} < \infty$$
 (~ the Wiener class)
2) *a* is real-valued $\Leftrightarrow T_n(a) = (T_n(a))^*, \quad \forall n \in \mathbb{N}.$

Theorem (Kac, Murdock, Szegő, 1953)

$$\lim_{n\to\infty}\frac{1}{n}\operatorname{Tr}(\varphi(T_n(a)))=\frac{1}{2\pi}\int_0^{2\pi}\int_0^1\varphi(a(x,t))\mathrm{d}x\mathrm{d}t,\quad\forall\varphi\in\mathcal{C}(\mathbb{R}).$$

(I)

A numerical illustration

Example: $a(x,t) = 2x^3e^{-2it} + xe^{-it} + (1-x^2) + xe^{it} + 2x^3e^{-2it}$

The AED μ :

$$\mu((\alpha,\beta)) = \frac{1}{2\pi} \left| \left\{ (x,t) \in [0,1] \times [0,2\pi] \mid \alpha < a(x,t) < \beta \right\} \right|$$

3) Self-adjoint KMS matrices

・ロト ・回ト ・ヨト ・ヨト

Non-Self-adjoint KMS matrices

• Similarly as in the case of Toeplitz matrices, we drop the self-adjointness assumption and consider banded KMS matrices.

э

Non-Self-adjoint KMS matrices

- Similarly as in the case of Toeplitz matrices, we drop the self-adjointness assumption and consider banded KMS matrices.
- Let us look at the numerics first...

Example

$$a(x,t) = ixe^{-it} + 3(1-x^2) + ixe^{it}$$

$$T_n(a) = \begin{pmatrix} 3 - \frac{3}{n^2} & \frac{i}{n} & & \\ \frac{i}{n} & 3 - \frac{12}{n^2} & \frac{2i}{n} & & \\ & \frac{2i}{n} & 3 - \frac{27}{n^2} & \frac{3i}{n} & \\ & \ddots & \ddots & \ddots & \ddots & \\ & & & & \frac{n-1}{n}i & 3 \end{pmatrix},$$

Example

$$a(x, t) = ixe^{-it} + 3(1 - x^2) + ixe^{it}$$

Nothing is known :(

• Basically nothing is known about the AED of non-self-adjoint KMS matrices.

Conjecture

For a banded KMS matrix, $\Lambda(T(a))$ is a connected set that equals a finite union of open analytic arcs and finite number of points. In addition, the AED exists and is supported on $\Lambda(T(a))$.

• Our inability to solve this problem in general motivates us to investigate some special cases -A research project in collaboration with O. Turek and P. Blaschke, work in progress.

The special KMS matrices (Sampling Jacobi matrices):

$$a(x,t) = \alpha(x)e^{-it} + \beta(x) + \alpha(x)e^{it},$$

where $\alpha^2, \beta \in \mathbb{C}[x]$ of low degree.

- Basically nothing is known about the AED of non-self-adjoint KMS matrices.
- Based on numerical experiments and the known AED for banded Toeplitz matrices, one can formulate the following conjecture.

Conjecture

For a banded KMS matrix, $\Lambda(T(a))$ is a connected set that equals a finite union of open analytic arcs and finite number of points. In addition, the AED exists and is supported on $\Lambda(T(a))$.

 Our inability to solve this problem in general motivates us to investigate some special cases -A research project in collaboration with O. Turek and P. Blaschke, work in progress.

The special KMS matrices (Sampling Jacobi matrices):

 $a(x,t) = \alpha(x)e^{-it} + \beta(x) + \alpha(x)e^{it},$

where $\alpha^2, \beta \in \mathbb{C}[x]$ of low degree.

 In this setting, there is a close connection between det(z - T_n(a)) and the hypergeometric orthogonal polynomials. We make use of some special properties of these polynomials.

Definition:

The Cauchy transform of a Borel measure μ is a function defined by

$$\mathcal{C}_{\mu}(z) := \int_{\mathbb{C}} \frac{\mathrm{d}\mu(x)}{z-x}, \quad z \in \mathbb{C} \setminus \operatorname{supp} \mu.$$

Definition:

The Cauchy transform of a Borel measure μ is a function defined by

$$\mathcal{C}_{\mu}(z) := \int_{\mathbb{C}} \frac{\mathrm{d}\mu(x)}{z-x}, \quad z \in \mathbb{C} \setminus \operatorname{supp} \mu.$$

If μ_n is the eigenvalue-counting measure and $p_n(z) = \det(z - T_n(a))$, then

$$C_{\mu_n}(z) = rac{p'_n(z)}{np_n(z)}.$$

Definition:

The Cauchy transform of a Borel measure μ is a function defined by

$$\mathcal{C}_{\mu}(z) := \int_{\mathbb{C}} \frac{\mathrm{d}\mu(x)}{z-x}, \quad z \in \mathbb{C} \setminus \operatorname{supp} \mu.$$

If μ_n is the eigenvalue-counting measure and $p_n(z) = \det(z - T_n(a))$, then

$$C_{\mu_n}(z)=rac{p_n'(z)}{np_n(z)}.$$

Theorem

Let μ_n is a sequence of probability measures supported uniformly in a compact set $K \subset \mathbb{C}$. Assume that

$$\lim_{n\to\infty} C_{\mu_n}(z) = C(z), \quad \text{ a.e. } z\in\mathbb{C}.$$

Then *C* is the Cauchy transform of a probability measure μ which is a weak limit of μ_n for $n \to \infty$. Moreover, one has

$$\mu = \frac{1}{\pi} \partial_{\overline{z}} C$$
 in the generalized sense.

• The main difficultly of the strategy: $p_n(z) \sim ?$ for $n \to \infty$.

(D) (A) (A) (A)

- The main difficultly of the strategy: $p_n(z) \sim ?$ for $n \to \infty$.
- There are many powerful methods for the asymptotic analysis but it usually requires a more detailed knowledge about p_n (generating functions, integral representations, recurrences,...).

$$\begin{aligned} \alpha(x) &= \sqrt{ax}, \quad (a > 0), \\ \beta(x) &= \mathrm{i}x, \end{aligned} \qquad \qquad T_n = \begin{pmatrix} \beta\left(\frac{1}{n}\right) & \alpha\left(\frac{1}{n}\right) & & \\ \alpha\left(\frac{1}{n}\right) & \beta\left(\frac{2}{n}\right) & \alpha\left(\frac{2}{n}\right) & \\ & \ddots & \ddots & \ddots \\ & & \alpha\left(\frac{n-1}{n}\right) & \beta\left(1\right) \end{pmatrix}, \end{aligned}$$

æ

・ロト ・ 日 ・ ・ ヨ ・ ・ ヨ ・

$$\begin{aligned} \alpha(x) &= \sqrt{ax}, \quad (a > 0), \\ \beta(x) &= \mathrm{i}x, \end{aligned} \qquad \qquad T_n = \begin{pmatrix} \beta \left(\frac{1}{n}\right) & \alpha \left(\frac{1}{n}\right) & \\ \alpha \left(\frac{1}{n}\right) & \beta \left(\frac{2}{n}\right) & \\ \ddots & \ddots & \ddots \\ & & \alpha \left(\frac{n-1}{n}\right) & \beta(1) \end{pmatrix}, \end{aligned}$$

• The characteristic polynomial of *T_n* can be identified with the Charlier polynomials:

$$p_n(z) = C_n^{(-an)} \left(-an - izn - 1\right),$$

where $C_n^{(\alpha)}(x)$ are the Charlier polynomials.

・ロト ・回ト ・ヨト ・ヨト

$$\begin{aligned} \alpha(x) &= \sqrt{ax}, \quad (a > 0), \\ \beta(x) &= \mathrm{i}x, \end{aligned} \qquad \qquad T_n = \begin{pmatrix} \beta \left(\frac{1}{n}\right) & \alpha \left(\frac{1}{n}\right) & \\ \alpha \left(\frac{1}{n}\right) & \beta \left(\frac{2}{n}\right) & \alpha \left(\frac{2}{n}\right) \\ & \ddots & \ddots & \ddots \\ & & \alpha \left(\frac{n-1}{n}\right) & \beta (1) \end{pmatrix}, \end{aligned}$$

• The characteristic polynomial of *T_n* can be identified with the Charlier polynomials:

$$p_n(z) = C_n^{(-an)} \left(-an - izn - 1\right),$$

where $C_n^{(\alpha)}(x)$ are the Charlier polynomials.

 Certain nice properties of the Charlier polynomials (representation by contour integrals) allow us to analyze the asymptotic behaviour of p_n(z) for n → ∞.

$$\begin{aligned} \alpha(x) &= \sqrt{ax}, \quad (a > 0), \\ \beta(x) &= \mathrm{i}x, \end{aligned} \qquad \qquad T_n = \begin{pmatrix} \beta \left(\frac{1}{n}\right) & \alpha \left(\frac{1}{n}\right) & \\ \alpha \left(\frac{1}{n}\right) & \beta \left(\frac{2}{n}\right) & \alpha \left(\frac{2}{n}\right) \\ & \ddots & \ddots & \\ & & \alpha \left(\frac{n-1}{n}\right) & \beta(1) \end{pmatrix}, \end{aligned}$$

• The characteristic polynomial of T_n can be identified with the Charlier polynomials:

$$p_n(z) = C_n^{(-an)} \left(-an - izn - 1\right),$$

where $C_n^{(\alpha)}(x)$ are the Charlier polynomials.

- Certain nice properties of the Charlier polynomials (representation by contour integrals) allow us to analyze the asymptotic behaviour of p_n(z) for n → ∞.
- The analysis is very technical (steepest descent, Stokes phenomenon).

An appetizer - final results

• Define the curve:

$$\gamma(x) := x + \mathrm{i} y(x), \quad x \in (-2\sqrt{a}, 2\sqrt{a}),$$

where y is the solution of

$$y'(x) = -\frac{\Im \log \left((1 + \xi_+)/(1 + \xi_-) \right)}{\Re \log \left((1 + \xi_+)/(1 + \xi_-) \right)}, \quad y(2\sqrt{a}) = 1,$$

 $\xi_{\pm} = \xi_{\pm}(z, a)$ are the two solutions of $a\xi^2 - (1 + iz)\xi - 1 = 0$, and z = x + iy(x).

An appetizer - final results

• Define the curve:

$$\gamma(x) := x + iy(x), \quad x \in (-2\sqrt{a}, 2\sqrt{a}),$$

where y is the solution of

$$y'(x) = -\frac{\Im \log ((1 + \xi_+)/(1 + \xi_-))}{\Re \log ((1 + \xi_+)/(1 + \xi_-))}, \quad y(2\sqrt{a}) = 1,$$

 $\xi_{\pm} = \xi_{\pm}(z, a)$ are the two solutions of $a\xi^2 - (1 + iz)\xi - 1 = 0$, and z = x + iy(x).

An appetizer - final results

• Define the curve:

$$\gamma(x) := x + iy(x), \quad x \in (-2\sqrt{a}, 2\sqrt{a}),$$

where y is the solution of

$$y'(x) = -\frac{\Im \log \left((1 + \xi_+)/(1 + \xi_-) \right)}{\Re \log \left((1 + \xi_+)/(1 + \xi_-) \right)}, \quad y(2\sqrt{a}) = 1,$$

 $\xi_{\pm} = \xi_{\pm}(z, a)$ are the two solutions of $a\xi^2 - (1 + iz)\xi - 1 = 0$, and z = x + iy(x).

• $y_0(a)$ is the imaginary coordinate of the intersection of the curve and the imaginary line.

Regime 1: $a > y_0(a)$

$$\frac{d\mu}{dx}(x) = \frac{1}{2\pi} \frac{|\log\left((1+\xi_+)/(1+\xi_-)\right)|^2}{\Re\log\left((1+\xi_+)/(1+\xi_-)\right)}, \qquad |x| < 2\sqrt{a}.$$

Regime 2: $a < y_0(a)$

$$\frac{\mathrm{d}\mu}{\mathrm{d}x}(x) = \frac{1}{2\pi} \frac{\left|\log\left((1+\xi_+)/(1+\xi_-)\right)\right|^2}{\Re\log\left((1+\xi_+)/(1+\xi_-)\right)}, \quad \text{an}$$

and
$$\frac{d\mu}{dy}(y) = 1.$$
